Model M3i.32XX, 12 bit transient recorder
up to 500 MS/s

- Up to 500 MS/s on one channel or 250 MS/s on two channels
- Simultaneously sampling on all channels
- Separate monolithic ADC and amplifier per channel
- 6 input ranges: ±200 mV up to ±10 V
- Up to 2 synchronous digital channels with multi-purpose I/O
- Up to 2 GSample (4 GByte) on-board memory
- 128 MSample standard memory installed
- Window, re-arm, OR/AND trigger
- Synchronization of up to 8 cards per system
- Options: Multiple Recording, Timestamps

- 66 MHz 32 bit PCI-X interface
- 5V / 3.3V PCI compatible
- 100% compatible to conventional PCI > V2.1
- Sustained streaming mode up to 245 MB/s
- 2.5 GBit x1 PCIe Interface
- Works with x1/x4/x8/x16* PCIe slots
- Software compatible to PCI
- Sustained streaming mode up to 160 MB/s

**General Information**

The 4 models of the M3i.32xx series are designed for the fast and high quality data acquisition. Each of the input channels has its own monolithic A/D converter and its own programmable input amplifier. This allows to record signals simultaneously on both channels with 12 bit resolution without any phase delay between them. The extremely large on-board memory allows long time recording even with the highest sampling rates. All boards of the M3i.32xx series may use the whole installed on-board memory for the currently activated number of channels. A FIFO mode is also integrated on the board. This allows the acquisition of data continuously for online processing or for data storage to hard disk.

*Some x16 PCIe slots are for the use of graphic cards only and can not be used for other cards.*
Model M3i.32XX, 12 bit transient recorder up to 500 MS/s

Software Support

Windows drivers
The cards are delivered with drivers for Windows 2000, XP, XP64, Vista and Vista64. Programming examples for Visual C++, Borland C++ Builder, LabWindows/CVI, Borland Delphi, Visual Basic, VB.NET, C# and J# are included.

Linux Drivers
All cards are delivered with full Linux support. Pre compiled kernel modules are included for the most common distributions like RedHat, Fedora, Suse or Debian. The Linux support includes SMP systems, 32 bit and 64 bit systems, versatile programming examples for Gnu C++ as well as the possibility to get the driver sources for own compilation.

Sbench 6
A base licence of Sbench 6 the easy-to-use graphical operating software for the Spectrum cards is included in the delivery. Using the base licence is possible to test the card and to show acquired data. There are also some basic measurement functions included in the base license.

The card comes with a demo license for the professional version giving the user the opportunity to test the features of the professional version with the new hardware. Existing customers have the opportunity to request a demo licence for the professional version at Spectrum. The professional version contains several new measurement functions, FFT, import and export (including MATLAB and ASCII) as well as the streaming modes. The streaming modes allow to continuously acquire data to hard disk. Sbench 6 has been optimized to handle data files of several GByte.

Third-party products
A lot of third-party products are supported as an option. Choose between LabVIEW, MATLAB and Agilent VEE. All drivers come with examples and detail ed documentation.

Hardware features and options

PCI/PCI-X
The cards with PCI/PCI-X bus connector use 32 Bit and up to 66 MHz clock rate for data transfer. They are 100% compatible to Conventional PCI > V2.1. The universal interface allows the use in PCI slots with 5 V I/O and 3.3 V I/O voltages as well as in PCI-X or PCI 64 slots. The maximum sustained data transfer rate is 245 MByte/s per bus segment.

PCI Express
The cards with PCI Express use a x1 PCIe connector. They can be used in PCI Express x1/x4/x8/x16 slots, except special graphic card slots, and are 100% software compatible to Conventional PCI > V2.1. The maximum sustained data transfer rate is 160 MByte/s per slot.

Input Amplifier
The analog inputs can be adapted to real world signals using a wide variety of settings that are individual for each channel. By using software commands the input termination can be changed between 50 Ohm and 1 MOhm, one can select a matching input range and the signal offset can be compensated by programmable AC coupling.

Software selectable input path
For each of the analog channels the user has the choice between two analog input paths. The ’Buffered’ path offers the highest flexibility when it comes to input ranges and termination. A software programmable 50 Ohm and 1 MOhm termination also allows to connect standard oscilloscope probes to the card. The „50 Ohm“ path on the other hand provides the highest bandwidth and the best signal integrity with a fewer number of input ranges and a fixed 50 Ohm termination.

Software selectable lowpass filter
Each analog channel contains a software selectable low-pass filter to limit the input bandwidth. Reducing the analog input bandwidth results in a lower total noise and can be useful especially with low voltage input signals.

Automatic on-board calibration
All of the channels are calibrated in factory before the board is shipped. To compensate for different variations like PC power supply, temperature and aging, the software driver provides routines for an automatic onboard offset and gain calibration of all input ranges of the „Buffered“ path. All cards contain a high precision on-board calibration reference.

Digital inputs
This option adds additional synchronous digital channels phase-stable with the analog data. A maximum of 2 additional digital inputs is available on the front plate of the board using the multi-purpose I/O lines.

Ring buffer mode
The ring buffer mode is the standard mode of all oscilloscope boards. Data is written in a ring memory of the board until a trigger event is detected. After the event the posttrigger values are recorded. Because of this continuously recording into a ring buffer there are also examples prior to the trigger event visible. Pretrigger = Memsize - Posttrigger.

FIFO mode
The FIFO mode is designed for continuous data transfer between measurement board and PC memory (up to 245 MB/s on a PCI-X slot, up to 125 MB/s on a PCI slot and up to 160 MB/s on a PCI slot) or hard disk. The control of the data stream is done automatically by the driver on interrupt request. The complete installed onboard memory is used for buffer data, making the continuous streaming extremely reliable.

Channel trigger
The data acquisition boards offer a wide variety of trigger modes. Besides the standard signal checking for level and edge as known from oscilloscopes it’s also possible to define a window trigger. All trigger modes can be combined with re-arming mode (for accu-

Model M3i.32XX_20090621  Page 2  FAST ComTec GmbH, Grünwalder Weg 28a, 82041 Oberhaching, phone: 49-(0)89 665180 -0, fax: 49-(0)89 665180 40, http://www.fastcomtec.com
rate trigger recognition on noisy signals) the AND/OR conjunction of different trigger events is possible.

**External trigger input**

All boards can be triggered using an external analog or digital signal. It’s possible to use positive or negative edge. As two analog comparators are used, one can also define a window trigger, a hysteresis trigger or a re-arm trigger.

**Universal Multi-Purpose I/Os**

All M3i cards offer two universal multi-purpose I/O lines, which can be separately programmed as either input or output. These lines can be used as additional TTL trigger inputs for more complex trigger conditions. Additionally these lines can also be used to acquire digital data synchronously with the analog data (see Digital Inputs). When used as outputs, these lines can be used to output card status signals like trigger-armed or to output the trigger to synchronize external equipment.

**Multiple Recording**

The Multiple Recording option allows the recording of several trigger events with an extremely short re-arming time. The hardware doesn’t need to be restarted in between in several segments of the same size. Each of them is filled with data if a trigger event occurs. Pre- and posttrigger of the segments can be programmed. The number of acquired segments is only limited by the used memory and is unlimited when using FIFO mode.

**ABA mode**

The optional ABA mode combines slow continuous data recording with fast acquisition on trigger events. The ABA mode works like a slow data logger combined with a fast digitizer. The exact position of the trigger events is stored as timestamps in an extra memory.

**Timestamp**

The timestamp option writes the time positions of the trigger events in an extra memory. The timestamps are externally synchronised to a radio clock, option acquisitions of systems on a defined zero time, external clock input and output. Using a dedicated connector a sampling clock can be fed in from an external system. Additionally it’s also possible to output the internally used sampling clock an a separate connector to synchronize external equipment to this clock.

**Reference clock**

The option to use a precise external reference clock (normally 10 MHz) is necessary to synchronize the board for high-quality measurements with external equipment (like a signal source). It’s also possible to enhance the quality of the sampling clock in this way. The driver automatically generates the requested sampling clock from the fed in reference clock.

**Star-Hub**

The star-hub is an additional module allowing the phase stable synchronisation of up to 8 boards in one system. Independent of the number of boards there is no phase delay between all channels. The star-hub distributes trigger and clock information between all boards that are running with the same clock and the same trigger. All trigger sources can be combined with a logical OR allowing all channels of all cards to be trigger source at the same time.

**BaseXIO (enhanced timestamps)**

The BaseXIO option offers 8 asynchronous digital I/O lines on the base card, which are available on a separate bracket as SMB connectors. The direction can be selected by software in groups of four. In addition one of the I/O lines can be used as reference clock for the Timestamp counter.
## Technical Data

### Analog Inputs
- **Resolution**: 12 bit
- **Differential non linearity (DN)**: ±1.0 LSB (ADC)
- **Integral non linearity (IN)**: ±2.5 LSB (ADC)
- **Offset error**: can be calibrated by user
- **Gain error**: can be calibrated by user
- **Programmable input offset**: not available
- **Crosstalk**: 1 MHz signal, 50 Ohm term
- **Input signal with 50 Ohm termination**: max 5 Vrms
- **Input impedance (high impedance path)**: 50 Ohm / 1 MOhm // 25 pF
- **Input impedance (high bandwidth path)**: 50 Ohm // TBD
- **Over voltage protection (range ≤ ±1 V)**: TBD / TBD (AC / DC coupled)
- **Over voltage protection (range > ±1 V)**: TBD / TBD (AC / DC coupled)
- **Connector (analog inputs)**: 3 mm SMB male

### Trigger
- **Multiple Recording**: re-arming time ≤ 32 Samples
- **Max Pretrigger at standard mode**: up to full memory
- **Max Pretrigger at Multi and FIFO**: 8,192 Samples as sum of all active channels
- **Internal trigger accuracy**: 1 Sample
- **Channel trigger resolution**: 10 bits
- **Trigger output delay**: TBD
- **External trigger type (ExO)**: Analog window comparator
- **Programmable trigger levels (ExO)**: 2 levels ± /- 5V in steps of 1 mV
- **Ext. trigger connector (ExO)**: MMCX female
- **Ext. trigger max voltage 1 MOhm (ExO)**: ±30 V
- **Ext. trigger max voltage 50 Ohm (ExO)**: 5V rms
- **Ext. trigger impedance (ExO)**: 50 Ohm / 1 MOhm // TBD
- **External trigger accuracy (All)**: ±1 Sample
- **Trigger output**: see multi purpose I/O lines below

### Power consumption (max speed)

<table>
<thead>
<tr>
<th>Model</th>
<th>Power Consumption (max speed)</th>
</tr>
</thead>
<tbody>
<tr>
<td>M3i.32x0 (128 MS memory)</td>
<td>50 A / 0.1 A (128 MS memory)</td>
</tr>
</tbody>
</table>

### BasexIO (Option)
- **BasexIO Connector (extra bracket)**: 8 x SMB male (8 x MMCX female internal)
- **BasexIO input**: TTL compatible: Low ≤ 0.8 V, High ≥ 2.0 V
- **BasexIO initial voltage**: TTL compatible: Low ≤ 0.4 V, High ≥ 2.4 V
- **BasexIO output drive strength**: 32 mA maximum current

### Multi purpose digital I/O
- **No of multi purpose lines**: two
- **Connector Type**: BasexIO female
- **Additional BasexIO trigger, digital input, async input**: 10 kΩ against 3.3 V
- **Input: available input signals**: TBD
- **Input: digital delay to analog sample**: TBD
- **Input: maximum voltage**: ±0.3 V up to ±5.5 V
- **Input: input voltage level**: Low ≤ 0.8 V, High ≥ 2.0 V
- **Output: available output signals**: trigger, overrange, arm, run, async output
- **Output: output impedance**: 50 Ohm
- **Output: output levels**: Low ≤ 0.4 V, High ≥ 2.4 V
- **Output: output type**: TTL compatible for high-impedance loads
- **Output: output drive strength**: Capable of driving 50 Ohm load

### Certifications, Compliances, Warranty
- **EMC immunity**: Compliant with CE Mark
- **EMC Emission**: Compliant with CE Mark
- **Product warranty**: 2 years starting with the day of delivery

### Clock
- **Internal clock range**: 20 MHz to max (see table below)
- **Internal clock accuracy**: 32 ppm
- **Internal clock setup granularity**: 1 Hz
- **Clock range gaps (internal and external)**: 140 to 144 MHz, 281 to 287 MHz
- **External clock input connector/coupling**: MMCX female, AC coupled
- **External clock input termination**: 50 Ohm fixed
- **Reference clock: external clock range**: ≥ 10.0 MHz and ± 0.0 1 Hz
- **Sampling clock from ref clock range**: 20 MHz to max (see table below)
- **Sampling clock from ref clock granularity**: 1 kHz
- **External clock delay to internal ADC clock**: 3.7 ns (8 2 ns at synchronized cards)
- **External clock input type**: single-ended, 3.3V LVPECL
- **External clock min input swing**: 0.3 V peak peak
- **External clock maximum voltage**: 3.0 V peak peak
- **External clock duty cycle requirement**: 40% to 60%
- **External clock output connector/coupling**: MMCX female, AC coupled
- **External clock output type**: single-ended, 3.3V LVPECL
- **External clock output drive strength**: Capable of driving 50 ohm load

### Environmental and Physical details
- **Dimension (PCB only)**: 312 mm x 107 mm (full PCB length)
- **Width (Standard or star-hub 4)**: 1 full size slot
- **Width (star-hub 8)**: 2 full size slots
- **Width (with BasexIO)**: 1 full size slots + 1 half size slot
- **Weight (depending on options/channels)**: TBD
- **Warm up time**: 10 minutes
- **Operating temperature**: 0°C - 50°C
- **Storage temperature**: -10°C - 70°C
- **Humidity**: 10% to 90%

### PCI / PCI-X specfic details
- **PCI / PCIX bus slot type**: 32 bit 33/66 MHz
- **PCI / PCIX bus slot compatibility**: 32/64 bit, 33-133 MHz, 3.3 and 5 V I/O

### PCI EXPRESS specfic details
- **PCIe slot type**: x1
- **PCIe slot compatibility**: x1/x4/x8/x16*
  
*Some x16 PCIe slots are for graphic cards only and can not be used for other cards.

### Software programmable parameters
- **Input Ranges (Buffered path)**: ±200mV, ±500mV, ±1V, ±2V, ±5V, ±10V
- **Input Ranges (50 Ohm path)**: ±500mV, ±1V, ±2V, ±5V
- **Input Analogue input impedance**: 50 Ohm / 1 MOhm (Buffered path)
- **Input Analogue input coupling**: AC / DC
- **Analog Anti aliasing filter**: on/off
- **Clock mode**: Internal, external reference clock, sync
- **External trigger impedance**: 50 Ohm / 1 MOhm
- **External trigger coupling**: AC / DC
- **Trigger mode**: G30, Ch1, Ex0(Analog), Ex1/2( HOL, SW
- **Trigger level (channel)**: 10 bit resolution reading to input range
- **Trigger level (Ex0)**: 1 mV resolution: -5000 mV to +5000 mV
- **Trigger edge (channel + external)**: Rising edge, falling edge or both edges
- **Memory depth**: 8 up to [installed memory / number of active channels] in steps of 8 samples
- **Post trigger**: 0 up to 4 GSamples in steps of 8
- **Multiple Recording segment size**: 16 up to [installed memory / 2 / active channels] in steps of 16
- **Multiple Recording pretrigger**: 0 up to [16 samples / number of active channels]

</table>

A pure sine wave with > 99% amplitude of input range is measured with 50 ohms termination. SNR and RMS noise parameters may differ depending on the quality of the used PC. SNR = Signal to Noise Ratio, THD = Total Harmonic Distortion, SFDR = Spurious Free Dynamic Range, SINAD = Signal Noise and Distortion, ENOB = Effective Number of Bits. For a detailed description please see application note 002.
